SETUP GUIDE

Content Studio.

Your own content engine, live in two minutes. No code.
Twelve prompts and you're running.

Your content engine, in five tabs.

A private dashboard that holds your strategy, your drafts, your top posts, and the patterns working in your niche. The 12 prompts fill it in for you.

Drafts

Your caption board. Write by hand, or let a prompt write 5 for you. Copy any caption with one click when it's time to post.

Strategy

Your pillars, your voice rules, your active campaigns, your trigger words. The source of truth every other prompt reads from.

Performance

Last 30 days of your own posts, ranked. What's growing, what's flat. Top hooks and lowest performers, side by side.

Competitor Intel

Best hook patterns and best formats from the creators in your niche. Structural patterns, not topics. Refreshed on schedule.

Library

Every post you and your competitors have published, in one searchable feed. Sortable by engagement, format, source.

Settings

Brand name, accent color, niche, the handles to track. Edit any time. Everything in the dashboard updates instantly.

Three steps to a live dashboard.

Click, open, run. No coding, no setup chains, no environment variables to copy by hand. Each step is on its own page next.

01

Click Deploy.

Vercel makes you a private copy of the dashboard plus a free Supabase database in two minutes. You stay logged in to your own account the whole time.

02

Open your project in Claude Code.

Pull the code locally, open it, type *claude*. Claude reads your Supabase credentials automatically. You don't paste any keys.

03

Run the first prompt.

Paste prompt 1 into Claude Code. It reads your last 90 days of posts, finds your pillars, writes them into the Strategy tab. Refresh the page and you see them. That's it.

Ready when you are.

Deploy to Vercel →

STEP 01

Click Deploy.

The Deploy button (previous page) opens Vercel's clone flow. This is the screen you see.

The screenshot shows a web browser window with the URL `vercel.com/new/clone?repository-url=~/content-studio`. The page title is "Deploy your Content Studio". Below the title, it says "Click Deploy. Vercel creates your own copy + a Supabase project in 2 minutes. No code." There is a numbered list of four steps: 1. Vercel signs you in (GitHub or email), 2. Pick a project name, that becomes your dashboard URL, 3. A free Supabase database is created and connected for you, and 4. Two minutes later, your dashboard is live. To the right of the list is a form with three input fields: "PROJECT NAME" with the value "my-content-studio", "INTEGRATION" with the value "Supabase (auto-connect)", and "REGION" with the value "Auto". Below these fields is a large black "Deploy" button. At the bottom of the form, it says "Free Vercel hobby plan + free Supabase tier are enough."

- 1 **Sign in to Vercel.** GitHub login if you have one, email otherwise. Free hobby plan is enough.
- 2 **Name your project.** This becomes your dashboard URL. Pick something short.
- 3 **Approve the Supabase connection.** Vercel creates a free Supabase project for you and wires it in. You don't paste any keys.
- 4 **Click Deploy and wait two minutes.** When it finishes, you'll see your dashboard URL. Open it once to confirm.

STEP 02

Open your project in Claude Code.

Claude Code is the agent that runs the 12 prompts. It reads from and writes to your Supabase, fills your dashboard, learns your voice.

```
~/my-content-studio · Claude Code

$ claude

Read prompts/1-extract-pillars.md and run it. Pull my last 90 days from library_posts, identify 5 content pillars I post about, write them to the strategy table.

CLAUDE
Reading prompts/1-extract-pillars.md. Pulling self posts from the last 90 days.

✓ Read prompts/1-extract-pillars.md (74 lines)

✓ Query library_posts where source='self' and posted_at ≥ '2026-03-10' (47 posts)

Found 5 clear pillars based on topic clustering and engagement weighting.

✓ INSERT INTO strategy (pillars, voice, updated_at, updated_by) VALUES (...)

Done. Your 5 pillars are now in the dashboard under Strategy. Open the page and refresh.
```

- 1 **Pull the code locally.** On the Vercel project page, click "Clone repo" and follow the one-liner. Or skip this and use the GitHub Desktop button if you prefer clicking.
- 2 **Open the folder.** Drag it onto your terminal, or in your editor. Then type *claude*.
- 3 **That's all the setup.** Claude reads *.env.local* by itself. Your Supabase keys are already there from the Vercel deploy.

Run prompt 1. Then run the rest.

Open *prompts/1-extract-pillars.md*, paste the whole file into Claude Code, hit enter. Within a minute, the Strategy tab in your dashboard is populated. Then move down the list.

#	Prompt	When to run it
01	Extract pillars	First run. Then monthly to recheck.
02	Define voice	First run. Lock your tone of voice rules.
03	Analyze winners	Weekly. Learn what your audience rewards.
04	Competitor patterns	Every 3 days, after a scrape.
05	Draft caption	Whenever you need a new post.
06	Rewrite for voice	After 5, before posting.
07	Weekly review	Friday or Sunday, weekly.
08	Find new angles	Monthly. Beat creative fatigue.
09	Build content week	Sunday batch. 5 posts in one sitting.
10	Hook library	Once a month. Builds a swipe file.
11	Objection library	Monthly. Mines your comments for FAQs.
12	Monthly evolution	First day of the new month.

YOUR FIRST WEEK

A rhythm that actually sticks.

Most people run prompts 1 and 2 once, then settle into this loop.
About 90 minutes of focus across the week.

SUNDAY · 60 MIN

Batch the week.

Prompt 9 builds 5 drafts based on your pillars. You edit headlines, approve, schedule. Most of your weekly content lives here.

MON TO FRI · 5 MIN

Post, copy, go.

Open Drafts. Find today's post. Copy the caption. Post it on Instagram. Mark as posted. Total: 5 minutes a day.

FRIDAY · 15 MIN

Look back.

Prompt 7 reviews the week. What got reach, what flopped, what to repeat. Updates Strategy automatically.

FIRST OF THE MONTH · 30 MIN

Recalibrate.

Prompt 12 looks at the whole month. Suggests pillar tweaks, voice drift fixes, new angles to test. You approve or skip.

Three things that come up most.

Claude says the dashboard is empty.

That's normal until you run prompt 1. The dashboard waits for data. Open *prompts/1-extract-pillars.md*, paste it into Claude Code, refresh.

Claude asks for Supabase credentials.

They're already in *.env.local*, Vercel wrote them there. Tell Claude to look in that file. If the file is missing, redeploy from Vercel and pull again.

A prompt finishes but nothing shows up.

Open your dashboard URL in a new tab and refresh hard (Cmd+Shift+R or Ctrl+F5). Browser cache is the usual culprit.

Still stuck?
